PYTHON: OOP

Basics

```
# class definition
class Vector:
  pass
```

Basics

```
# class definition
class Vector:
  pass
# instance creation
v = Vector()
```

Basics

```
# class definition
class Vector:
   pass

# instance creation
v = Vector()

# you can add arbitrary attributes to instances
# (please don't)
v.a = 5
v.fn = lambda x: x + 1
```

Methods

```
class Vector:
 # special method called during instance creation
 # the first method parameter contains instance
 # (like C++ this)
  def __init__(self, x, y):
   self.x = x
    self.y = y
```

Methods

```
class Vector:
 # special method called during instance creation
 # the first method parameter contains instance
 # (like C++ this)
  def __init__(self, x, y):
    self.x = x
    self.y = y
  def move(self, x, y):
    self.x += x
    self.y += y
```

Methods

```
class Vector:
 # special method called during instance creation
 # the first method parameter contains instance
 # (like C++ this)
  def \underline{init}_{(self, x, y)}:
    self.x = x
    self.y = y
  def move(self, x, y):
    self.x += x
    self.y += y
v = Vector(1, 2)
v.move(2, 4) # == Vector.move(v, 2, 4)
V.X # 3
```

Static attributes and methods

```
class Vector:
    x = 0  # 'static' attribute

    @staticmethod
    def zero():
        return Vector(0, 0)

v = Vector(1, 2)
v.x # 1
Vector.x # 0
```

```
class Player:
    def __init__(self):
        self.position = Vector(0, 0)

def spawn_enemy_near_player(player):
    enemy_pos = player.position
    enemy_pos.move(10, 5)
```

```
class Player:
    def __init__(self):
        self.position = Vector(0, 0)

def spawn_enemy_near_player(player):
    enemy_pos = player.position
    enemy_pos.move(10, 5)
```

Objects won't be changed out of nowhere

```
class Player:
    def __init__(self):
        self.position = Vector(0, 0)

def spawn_enemy_near_player(player):
    enemy_pos = player.position
    enemy_pos.move(10, 5)
```

- Objects won't be changed out of nowhere
- Change detection is super easy (compare pointers)

```
class Player:
    def __init__(self):
        self.position = Vector(0, 0)

def spawn_enemy_near_player(player):
    enemy_pos = player.position
    enemy_pos.move(10, 5)
```

- Objects won't be changed out of nowhere
- Change detection is super easy (compare pointers)
- Multithreading-friendly

Properties

```
class Vector:
   def length(self):
     return math.sqrt(self.x ** 2 + self.y ** 2)
```

Properties

```
class Vector:
   def length(self):
     return math.sqrt(self.x ** 2 + self.y ** 2)

v = Vector(1, 0)
x = v.length # 1
```

Properties

```
class Vector:
    @property
    def length(self):
      return math.sqrt(self.x ** 2 + self.y ** 2)

v = Vector(1, 0)
x = v.length # 1
```

```
class Vector:
    @property
    def x(self):
        return self._x

@x.setter
    def x(self, value):
        if value < 0:
            raise Exception("Stay positive")
        self._x = x</pre>
```

```
class Vector:
  @property
  def x(self):
    return self._x
  @x.setter
  def x(self, value):
    if value < 0:
      raise Exception("Stay positive")
    self._x = x
v = Vector(1, 0)
v.x = 5
v.x = -5 \# raises an Exception
```

Encapsulation (public/private)?

```
class Vector:
    # by convention private methods begin with _
    def _a(self):
        pass

def __b(self):
    pass
```

Encapsulation (public/private)?

```
class Vector:
    # by convention private methods begin with _
    def _a(self):
        pass

    def __b(self):
        pass

v = Vector()
v._a()
# v.__b()  # doesn't work
v._Vector__b()  # mangled by interpreter
```

Polymorphism

```
class Car:
   def wheel_count(self):
     return 4

class Motorcycle:
   def wheel_count(self):
     return 2
```

Polymorphism

```
class Car:
    def wheel_count(self):
        return 4

class Motorcycle:
    def wheel_count(self):
        return 2

def print_wheels(obj):
    print(obj.wheel_count())
```

Polymorphism

```
class Car:
    def wheel_count(self):
        return 4

class Motorcycle:
    def wheel_count(self):
        return 2

def print_wheels(obj):
    print(obj.wheel_count())

print_val(Car())
print_val(Motorcycle())
```

Inheritance

```
class Car(object):
  def __init__(self, fuel):
    self.fuel = fuel
  def drive(self):
    self.fuel -= 1
```

Inheritance

```
class Car(object):
  def __init__(self, fuel):
    self.fuel = fuel
  def drive(self):
    self.fuel -= 1
class DieselCar(Car):
  def __init__(self, fuel):
   # parent constructor is not called automatically!
    super().__init__() # super() points to the first parent
  def drive(self):
    self.fuel -= 0.05
```

Multiple inheritance (**a)

```
class A:
    def __init__(self):
        print("A")

class B:
    def __init__(self):
        print("B")
```

Multiple inheritance (*🗟)

```
class A:
    def __init__(self):
        print("A")

class B:
    def __init__(self):
        print("B")

class C(A, B): pass
```

Multiple inheritance (*a)

```
class A:
    def __init__(self):
        print("A")

class B:
    def __init__(self):
        print("B")

class C(A, B): pass
class D(B, A): pass
```

Multiple inheritance (*a)

```
class A:
    def __init__(self):
        print("A")

class B:
    def __init__(self):
        print("B")

class C(A, B): pass
class D(B, A): pass

c = C()
```

Multiple inheritance (*🙃)

```
class A:
  def __init__(self):
      print("A")
class B:
  def __init__(self):
      print("B")
class C(A, B): pass
class D(B, A): pass
c = C() \# A
```

Multiple inheritance (**a)

```
class A:
    def __init__(self):
        print("A")

class B:
    def __init__(self):
        print("B")

class C(A, B): pass
class D(B, A): pass

c = C() # A
d = D()
```

Multiple inheritance (**a)

```
class A:
    def __init__(self):
        print("A")

class B:
    def __init__(self):
        print("B")

class C(A, B): pass
class D(B, A): pass

c = C() # A
d = D() # B
```

class Square: pass

class Rectangle(Square): pass

```
class Square: pass
class Rectangle(Square): pass
```

or

```
class Square: pass
class Rectangle(Square): pass
```

or

```
class Rectangle: pass
class Square(Rectangle): pass
```

```
class Square: pass
class Rectangle(Square): pass
```

or

```
class Rectangle: pass
class Square(Rectangle): pass
```

Neither! Prefer composition:

```
class Square:
    def __init__(self, side):
        self.rect = Rectangle(side, side)

    def area(self):
        return self.rect.area()

    def set_side(self, side):
        self.rect.set_width(side)
        self.rect.set_height(side)
```

Neither! Prefer composition:

```
class Square:
    def __init__(self, side):
        self.rect = Rectangle(side, side)

# no need for interfaces, polymorphism is for free
    def area(self):
        return self.rect.area()

def set_side(self, side):
        self.rect.set_width(side)
        self.rect.set_height(side)
```

```
class File: pass
```

```
class File: pass
